

DowFlake Xtra Calcium Chloride

DowFlake Xtra Calcium Chloride Attributes:

The advantages of calcium chloride flakes for snow and ice removal are that they provide a large flat surface area and stay put when applied. The flat profile allows them to sit on surfaces that are sloped or exposed to wind that would typically cause “roll-off” when using a pellet style deicer. Flakes pass easily through ice melt spreaders providing an even and consistent coverage when applied.

Calcium chloride flakes, like DowFlake Xtra, are highly effective at cold temperatures down to -25F.

Using Calcium Chloride flake in a dry mix can reduce salt use by as much as 60% when blended in a 1:4 ratio with rock salt.
